1.

Suppose your training examples are sentences (sequences of words). Which of the following refers to the j^{th} word in the i^{th} training example?

 $x^{(i) < j >}$

Correct

We index into the i^{th} row first to get the i^{th} training example (represented by parentheses), then the j^{th} column to get the j^{th} word (represented by the brackets).

- $\bigcirc \quad x^{< i > (j)}$
- $igg(x^{(j) < i >} igg)$
- $\bigcirc \quad x^{< j > (i)}$

2.

Consider this RNN:

This specific type of architecture is appropriate when:

$$T_x = T_y$$

Correc

It is appropriate when every input should be matched to an output.

- $igcap T_x < T_y$
- $T_x > T_y$
- $T_x = 1$

| To which of these tasks would you apply a many-to-one RNN architecture? (Check all that apply). Quiz, 10 questions | |
|---|--|
| Speech recognition (input an audio clip and output a transcript) | |
| Un-selected is correct | |
| Sentiment classification (input a piece of text and output a 0/1 to denote positive or negative sentiment) | |
| Correct! | |
| Image classification (input an image and output a label) | |
| Un-selected is correct | |
| Gender recognition from speech (input an audio clip and output a label indicating the speaker's gender) | |
| Correct Correct! | |
| 1/1 point | |
| 4. You are training this RNN language model. | |
| At the t^{th} time step, what is the RNN doing? Choose the best answer. | |
| $igcap 	ext{Estimating } P(y^{<1>}, y^{<2>}, \dots, y^{< t-1>})$ | |
| $igcup$ Estimating $P(y^{< t>})$ | |
| Estimating $P(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \ldots, y^{< t-1>})$ | |
| Correct Yes, in a language model we try to predict the next step based on the knowledge of all prior steps. | |
| Consisting $P(y^{< t>} \mid y^{< 1>}, y^{< 2>}, \ldots, y^{< t>})$ | |
| | |

| You Rechisted training and age work RNN and are using it to sample random sentences, as follows: Quiz, 10 questions | | | | | | | |
|--|---|--|--|--|--|--|--|
| Wh | at are you doing at each time step t ? | | | | | | |
| | (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step. | | | | | | |
| | (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass the ground-truth word from the training set to the next time-step. | | | | | | |
| | his should not be selected The ground-truth word from the training set is not the input to the next time-step. | | | | | | |
| | (i) Use the probabilities output by the RNN to pick the highest probability word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass this selected word to the next time-step. | | | | | | |
| | (i) Use the probabilities output by the RNN to randomly sample a chosen word for that time-step as $\hat{y}^{< t>}$. (ii) Then pass this selected word to the next time-step. | | | | | | |
| ~ | 1/1 point | | | | | | |
| | are training an RNN, and find that your weights and activations are all taking on the value of NaN ("Not a Number"). Which of se is the most likely cause of this problem? | | | | | | |
| | Vanishing gradient problem. | | | | | | |
| | Exploding gradient problem. | | | | | | |
| c | orrect | | | | | | |
| | ReLU activation function g(.) used to compute g(z), where z is too large. | | | | | | |
| | Sigmoid activation function g(.) used to compute g(z), where z is too large. | | | | | | |
| × | 0/1 point | | | | | | |
| | pose you are training a LSTM. You have a 10000 word vocabulary, and are using an LSTM with 100-dimensional activations $^>$. What is the dimension of Γ_u at each time step? | | | | | | |
| |) 1 | | | | | | |
| | 100 | | | | | | |
| | 300 | | | | | | |
| | 10000 | | | | | | |

ThRecultrents Networks

(

No, Γ_u is a vector of dimension equal to the number of hidden units in the LSTM. Quiz, 10 questions

8.

Here're the update equations for the GRU.

Alice proposes to simplify the GRU by always removing the Γ_u . I.e., setting Γ_u = 1. Betty proposes to simplify the GRU by removing the Γ_r . I. e., setting Γ_r = 1 always. Which of these models is more likely to work without vanishing gradient problems even when trained on very long input sequences?

- Alice's model (removing Γ_u), because if $\Gamma_r \approx 0$ for a timestep, the gradient can propagate back through that timestep without much decay.
- Alice's model (removing Γ_u), because if $\Gamma_r \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.
- Betty's model (removing Γ_r), because if $\Gamma_u pprox 0$ for a timestep, the gradient can propagate back through that timestep without much decay.

Correct

Yes. For the signal to backpropagate without vanishing, we need $c^{< t>}$ to be highly dependant on $c^{< t-1>}$.

Betty's model (removing Γ_r), because if $\Gamma_u \approx 1$ for a timestep, the gradient can propagate back through that timestep without much decay.

9

Here are the equations for the GRU and the LSTM:

From these, we can see that the Update Gate and Forget Gate in the LSTM play a role similar to _____ and ____ in the GRU. What should go in the the blanks?

 Γ_u and $1-\Gamma_u$

Correct

Yes, correct!

- \bigcap Γ_u and Γ_r
- $1-\Gamma_u$ and Γ_u
- $igcap \Gamma_r$ and Γ_u

10. Quiz, 10 questions

You have a pet dog whose mood is heavily dependent on the current and past few days' weather. You've collected data for the past 365 days on the weather, which you represent as a sequence as $x^{<1>},\ldots,x^{<365>}$. You've also collected data on your dog's mood, which you represent as $y^{<1>},\ldots,y^{<365>}$. You'd like to build a model to map from $x\to y$. Should you use a Unidirectional RNN or Bidirectional RNN for this problem?

| | Bidirectional RNN, | , because this allows the | prediction of mood | l on day t to take into acc | ount more information. |
|--|--------------------|---------------------------|--------------------|-----------------------------|------------------------|
|--|--------------------|---------------------------|--------------------|-----------------------------|------------------------|

Bidirectional RNN, because this allows backpropagation to compute more accurate gradients.

| | _ | | | |
|--|--------------------------------|---------------------------|-------------------------|-------------------|
| Unidirectional RNN, because the value of $y^{< t}$ | $^>$ depends only on $x^{<10}$ | \rightarrow r $< t >$ | but not on $r^{< t+1>}$ | r<365> |
| ornan ectional Kiviv, because the value of g | ucpchas only on u | $,\ldots,\omega$ | , but not on w | $, \dots, \omega$ |

Correct

Yes!

S P
